01 PROJECT OVERVIEW

02 DATA OVERVIEW

03 DETAILED ANALYSIS

04 MODELLING

05 RECOMMENDATION

Situation	The shop network signs 41.5K contracts and 539 bn VND a month (Q3/2026) across 5,331 active shops, 2.4× more shops than a year ago.
Complication	Growth comes from opening shops, not from better shops: 93% of growth is new shops, contracts per shop are flat (−3%), and 51% of shops sign less than 1 contract a month. Sales rankings cannot tell which shops can still grow.
Key Findings	• No action = no growth: Q4 BAU is 41.2K contracts a month (−0.7%). • Customers, not skills: top shops get ~8× more applications at the same approval and closing rates. • Measured levers add +6.1%; the network uses only 57% of its market ceiling. • Same sales ≠ same headroom: two shops at ~4 contracts a month can add +1.8 vs ~0.
Question	With limited sales resources, which shops should we invest in, how much will it return, and how do we prove it?
Answer	• Invest in 3,954 tier-A shops ranked by risk-adjusted headroom; start with the top 500 for +392 contracts and +6.4 bn VND a month. • Route ~21.8K campaign leads a quarter to shops below peer P75; add SA only at under-staffed Aldi shops; coach lead handling where closing is weak. • No growth targets for 465 high-risk shops; reactivate 696 and exit 1,464 inactive shops; expand in Hà Nội, Hải Phòng, Ninh Bình, Hưng Yên. • Prove it with a 3-month controlled pilot (~1,270 shops per arm) before scaling.

Market Research

Vietnam's consumer finance market is expanding, with broader digital reach and improving credit quality

Consumer lending is growing, but gains are uneven

≈ **26%**

in Vietnam's outstanding consumer loans in 2025, with banks growing nearly twice as fast as finance companies.

Market growth provides a favorable backdrop, but does not guarantee equivalent growth for every lender or shop.

Digital partnerships extend customer reach beyond physical shops

The Home Credit–BE partnership announced in 2024 introduced Home PayLater to a platform with

over 10 million users

A lender's potential customer reach extends beyond its physical network, supporting the need to examine shop contributions across channels.

Credit quality is improving alongside the sector's recovery

Finance companies' non-performing loan ratio fell from **11.2%** **in 2023**

7.2% **in 2025**

a reduction of **4%** **points**

Growth potential should be assessed alongside credit quality, rather than through contract volume alone.

Key takeaway

In a growing, increasingly connected market, shop potential should reflect both direct sales and the quality of customers brought into the wider lending ecosystem.

Problem statement

How is our network capturing this opportunity: through more shops, stronger performance per shop, or subsequent business from the customers those shops acquire?

Data preprocessing

Raw data would have misstated shop volume, lead counts and staffing

Data issues	
CONTRACT	• Only 72% of applications are booked (15% rejected, 13% cancelled); 1.05M unsigned rows carry placeholder date 3000-01-01; 49K (1.3%) have no product • DPD columns are 0/1 flags: 278K recent and 257K Jan–Feb 2025 contracts give false ~0% FPD
CONTRACT_PRODUCT	• Goods groups have spelling variants (26K rows merged, 21 → 14 groups) • Goods exist only for CD/TW, so price and billing are null elsewhere by design
LEADS	• sample_weight 19.66 on 2M down-sampled leads: 90% of weighted leads; 209K lead IDs re-assigned, so counting rows would double count • Coverage only 31/12/2025–17/10/2026, overlapping contracts for 9 months
CL_LEAD_FIN_REASON	• Dictionary maps CODE_LEAD_STATUS, but 99.7% of leads carry code 4 • Only RESULT separates outcomes (DEAL and REJECTED have a credit case in 100% of leads)
SALESROOM	• 54 province names mix old and new boundaries (112 shops on old names) • Only physical shops carry category and location; online hubs and other POS are outside the master
SELLER	• 15 salesrooms have no seller record • Chain sizes vary widely (mean 1.2 shops/seller, max 223)
EMP_2_SALESROOM	• 96% of SA assignments are shared across shops • Raw headcount overstates staffing ~25x (19–21 SAs vs ~0.7–0.8 FTE per shop)

- Removed 208,991 duplicate lead rows.
- No contract or shop rows dropped.
- booked flag, with approval and cancellation as separate drivers.

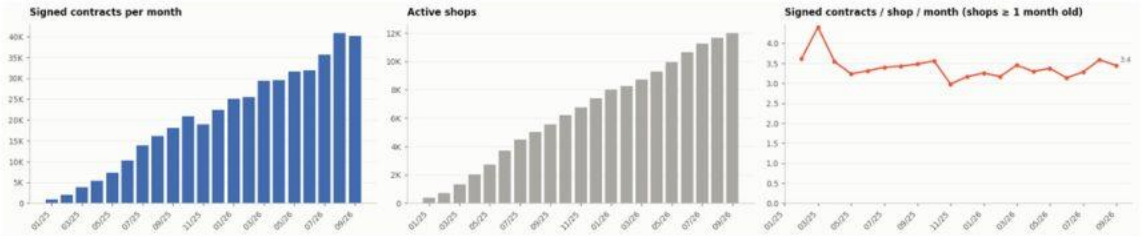

- Risk measured only on mature contracts
- Sentinel dates → null; missing product → “Unknown”.
- Finish reason from RESULT.
- Provinces 54 → 34; goods groups merged; staffing in FTE.

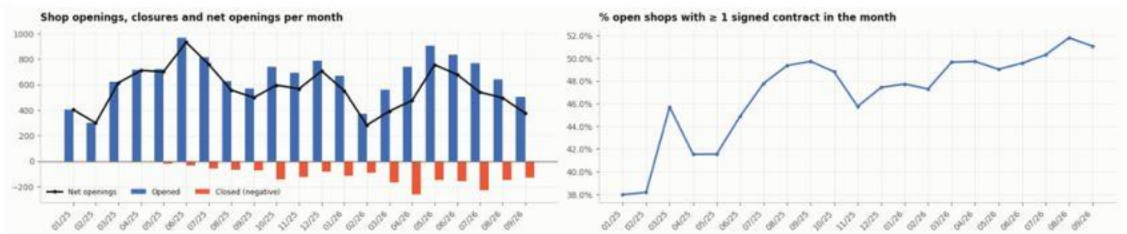

- Credit case and lead ID are unique; 0 unmapped provinces.
- DPD flags are binary, >99% of leads have a mapped finish code, FTE ≤ headcount.

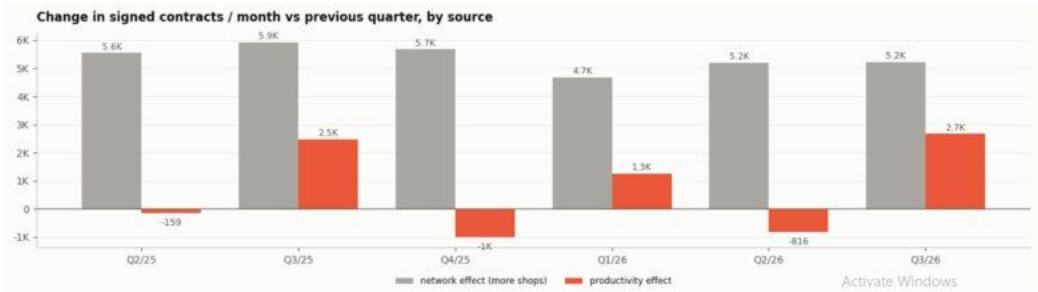

Business Overview

The network grows by adding shops, but per-shop conversion is low and current sales do not reveal how much each shop could still grow.

Growth comes from shop count, not productivity.

- **93%** of new contract growth driven by shop expansion; only **7%** from per-shop output.
- Average output stays flat at **~3 contracts/shop/month** (down **3%** for shops older than 3 months).
- Revenue/shop growth (**+20%**) relies entirely on higher average loan size (**+24%**), not volume.
- New openings slowed from **~900** to **~500/month**; ~**35%** of Q1/2025 shops have closed.
- Net openings fell to **~380/month**, with only **~50%** of active shops generating contracts monthly.

Low Shop-Level Conversion

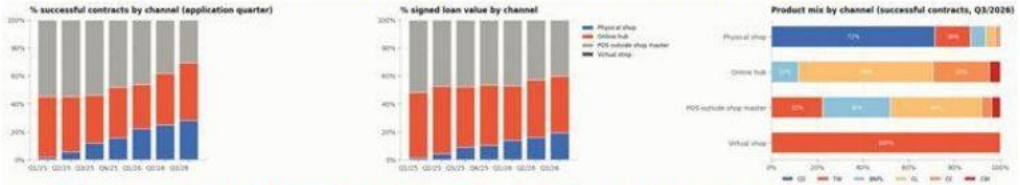

- **51%** of shops sign less than **1 contract** per month.
- Only **29%** of leads reach application stage; final contract conversion is just **23%**.
- Out of **100** applications → **79** approved → **72** signed → **64** first-payment compliant.
- Major drop-offs occur at lead-to-application conversion and risk rejection (**21%**).
- Once approved, customer sign-off is high, showing that approval and lead capture are the main hurdles.

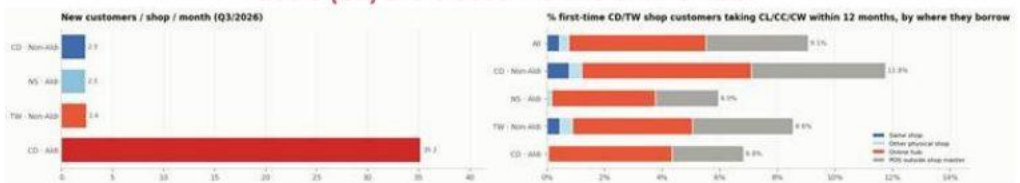

Business Overview

The network grows by adding shops, but per-shop conversion is low and current sales do not reveal how much each shop could still grow.

The shop serves as a consultation and registration point, but the revenue that can be tracked typically represents only the tip of the iceberg.

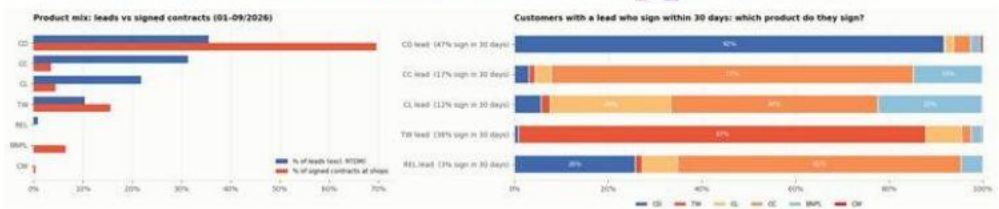

Shops account for 28%of contracts but 19% of the total value; high-value deals (CL) are closed via the online hub.

- 83% of the shop's customers are new
- 9.1% have taken out additional loans within the past 12 months

95% of them borrowed from other sources.

High-converting leads: CD/TW campaigns convert 2–4× higher than CC/CL campaigns.
Attribution gap: CL leads mostly buy different products

"same-product" rule fails to credit the originating shop.

Physical branches act as the main acquisition channel for new clients, with

83%

of branch contracts coming from first-time customers.

Branches account for 28% of total contract volume but only 19% of total portfolio value, as they focus on smaller Consumer Durable (CD) loans while high-value cash loans are handled online.

Cross-sales account for only 6.1% of the contracts generated by branches, and only 30% of branches have secured at least one cross-sale contract

KEY TAKEAWAY

- **Pivot to Per-Store Productivity: With physical network expansion plateauing, future growth relies on maximizing store-level conversion (including app conversions), rather than just direct in-store sales and cross-selling.**
- **Redefining Store Potential: Evaluated store performance must shift from lagging revenue metrics to demand-side leading indicators (applications, leads, foot traffic, and addressable market size).**

Business Overview

Each shop serves its own customer mix, and customer value varies widely

Two scores, one segmentation

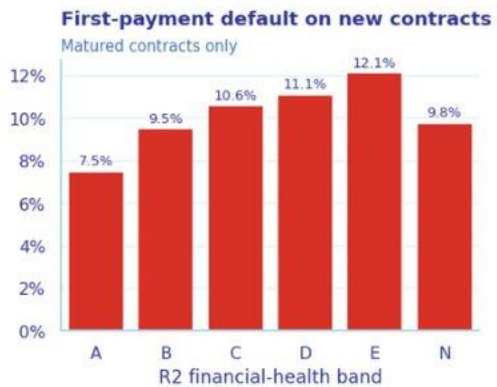

Financial Health	Can the customer manage today's finances and absorb shocks?	**LightGBM** with monotonic constraints
Engagement	Will the customer take a new loan soon?	**WoE scorecard** with logistic weights
Segmentation	Combine: Financial Health × Engagement	Rule matrix: **FH band × ENG level** Risk block first, then segment action

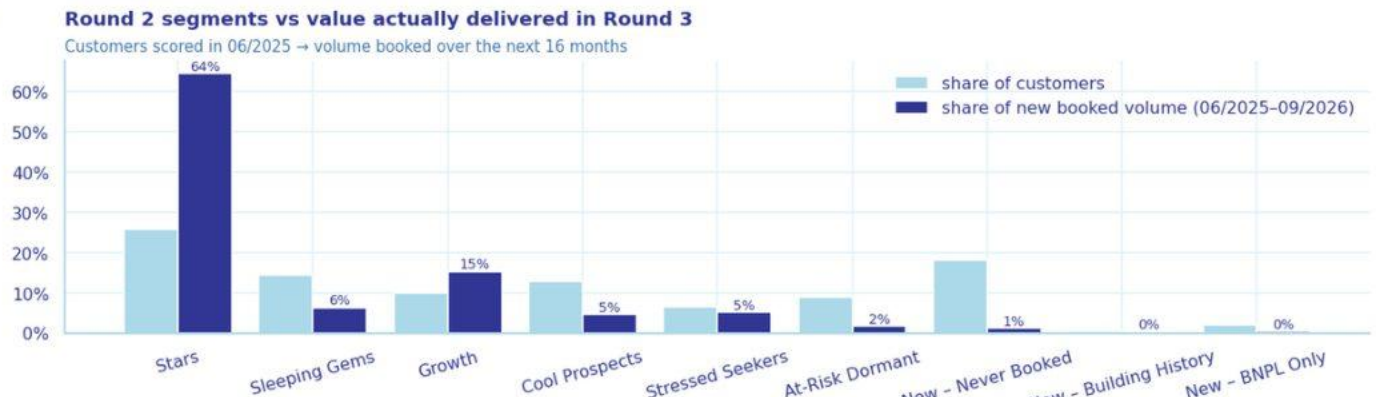

Financial Health	Engagement	Segmentation
0.674 AUC	**0.705** AUC	**9** segments

- Features use only data before 05/06/2025; labels come from the period after.
- Engagement excludes all Financial Health variables, so the two scores complement each other (ρ = 0.49).

Scores set in 06/2025 held up on 16 months of real Round 3 data

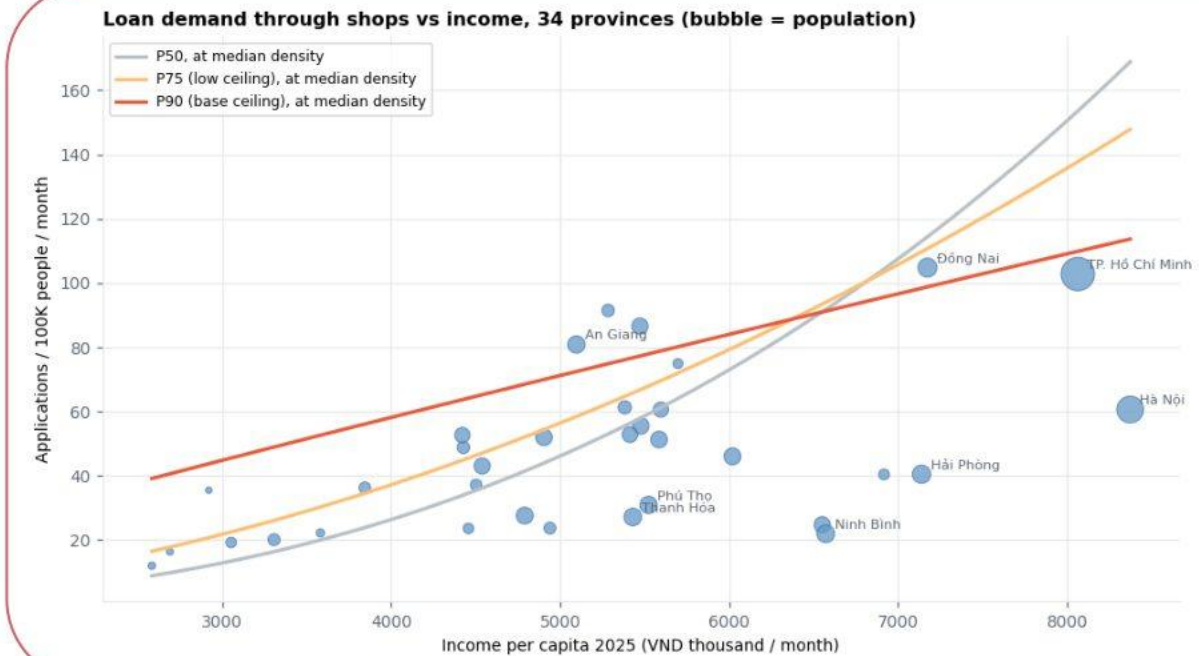

- Demand ranks correctly: Champions sign a new contract 40% of the time vs 5% for Dormant.
- Risk ranks correctly: first-payment default rises from 7.5% (band A) to 12.1% (band E).
- Value is concentrated: Stars are 26% of customers but bring 64% of new volume.

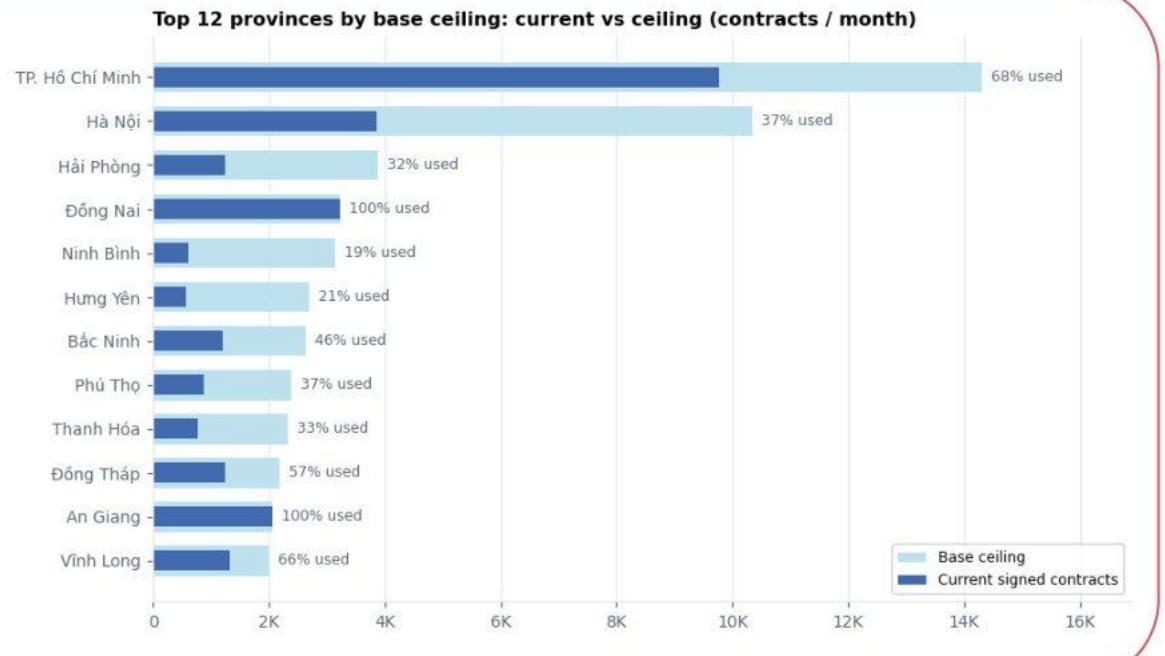

KEY TAKEAWAY

Customer value is uneven, so shops that attract different customers have different potential, and risk must be guarded. Next, the local market and partners add two more differences.

Business Overview

Local market and partners create two more differences between shops

- Demand ranges from 12 to 105 applications per 100K people across provinces and does not rise in a straight line with income.
- Hà Nội uses 37% of its base ceiling and Hải Phòng 32%, while Đồng Nai is already at 100%.
- Under-served provinces have the most room to grow; saturated ones need optimisation, not expansion.

- Chain and long-established dealers generate more applications.
- TW loans are about 2.5x larger than CD loans (median 22.5M vs 9.1M VND).
- Size, model and region labels each explain at most 5% of the gap between shops, so labels alone cannot rank potential.

KEY TAKEAWAY

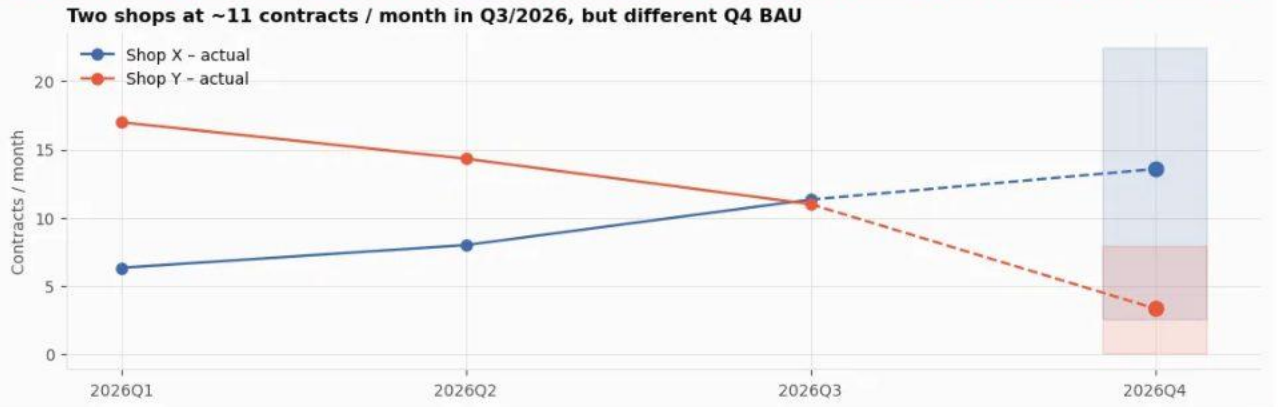

Two shops with the same sales can serve different customers, sit in different markets and work with different partners, so potential must be measured against shops with the same conditions, with a risk guardrail on every growth recommendation.

Problem and Question

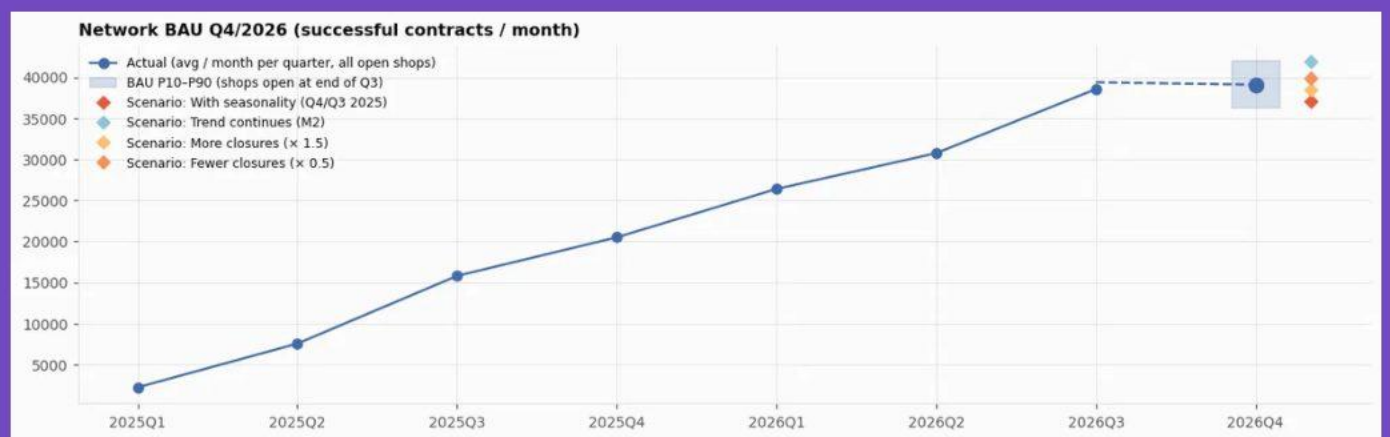

Sales rankings and peer averages cannot show which shops deserve investment.

Sales and peer averages cannot show headroom

- Sales ranking shows where a shop is, not how far it can go. 20% of 5,331 active shops make 68% of contracts, and 34% sell under 1 contract a month.
- Peer averages mislead. Small, Medium and Big labels do not separate strong shops from weak ones, so one target is too high for some and too low for others.
- Same sales, different headroom. Among shops selling 3–10 contracts a month, 764 are near their ceiling and 238 have large room.

Standing still means staying flat

- Q4 BAU is 41,186 contracts a month against 41,467 now (−0.7%).
- Value rises only 4.3%, from larger loans.
- 443 shops had no contract last month.

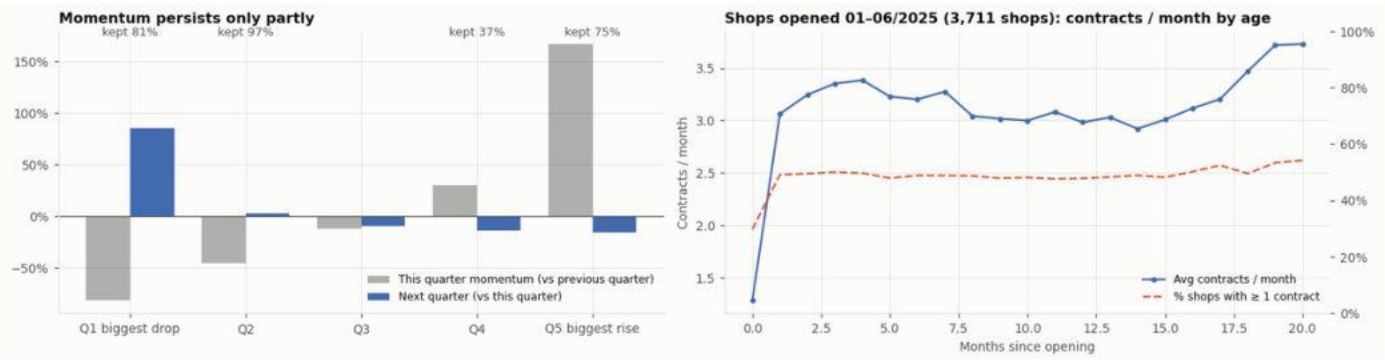

KEY TAKEAWAY

Given its own conditions, how big can each shop really become, what is holding it back, and with limited resources, which shops should we invest in, how much, and why?

Business-as-Usual

Without intervention, Q4/2026 lands at 41,186 contracts a month (−0.7%).

Two facts that shape the model

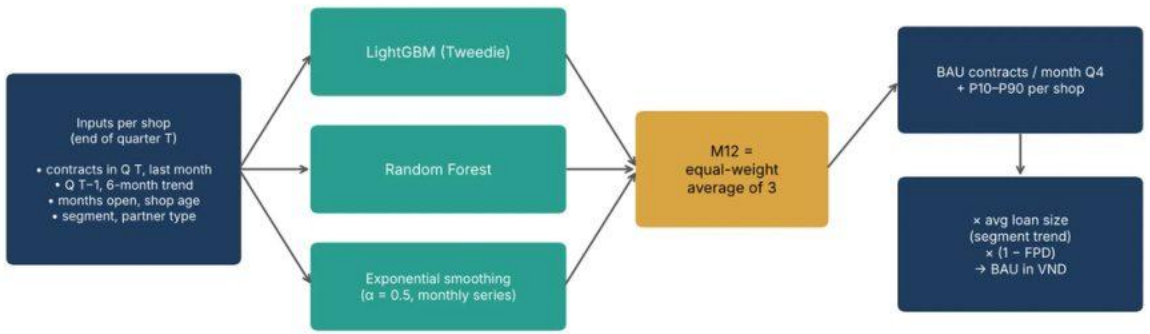

No new action

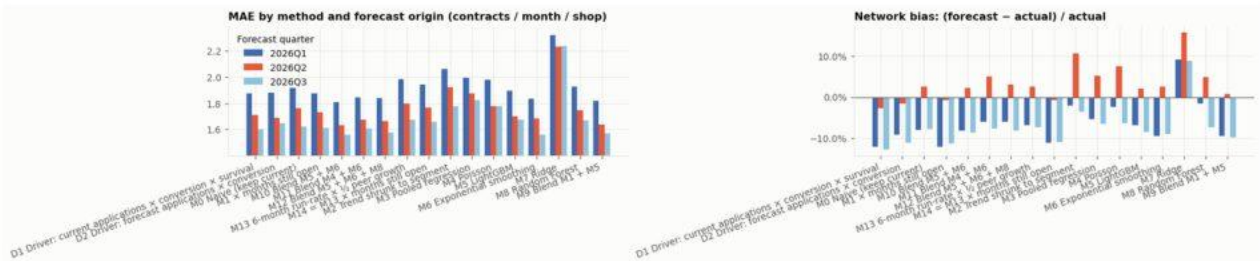

No extra staff, campaigns or policy changes; new shops keep maturing, shops may close

- Momentum persists only partly: the biggest risers and fallers keep about 75–80% of their last-quarter change, so BAU neither extrapolates the trend nor assumes “keep current”.
- No maturity effect: shops opened Jan–Jun 2025 reach about 3 contracts a month by month 2 and stay flat to month 20, so BAU is not scaled by shop age.

We tested 17 forecasting methods and chose the one that is both accurate and fair to every shop group

- Each shop is forecast three ways: machine learning on recent results, a decision-tree ensemble, and a smoothed trend.
- Averaging the three cancels out their individual blind spots, then converts contracts into VND.

- Each test forecasts a quarter using only data known at the time (Q1, Q2, Q3 2026).
- M12 ranks near the top in all three, so the result is not luck from one quarter.

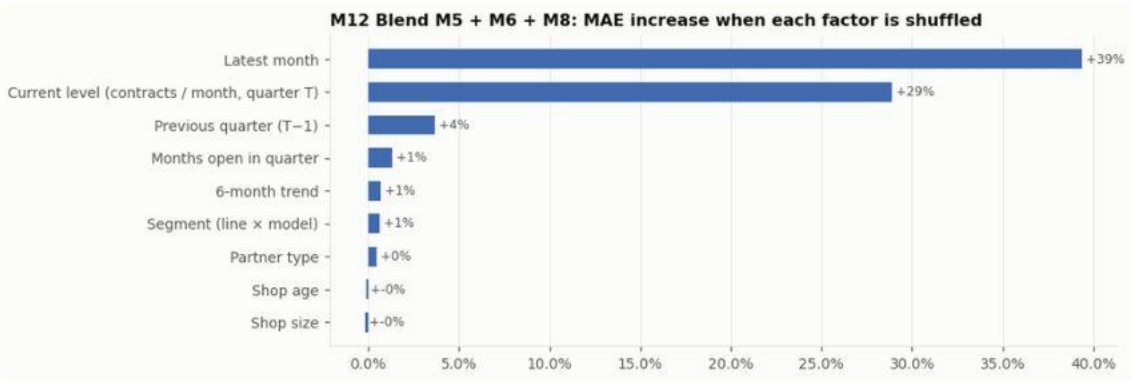

Key takeaway

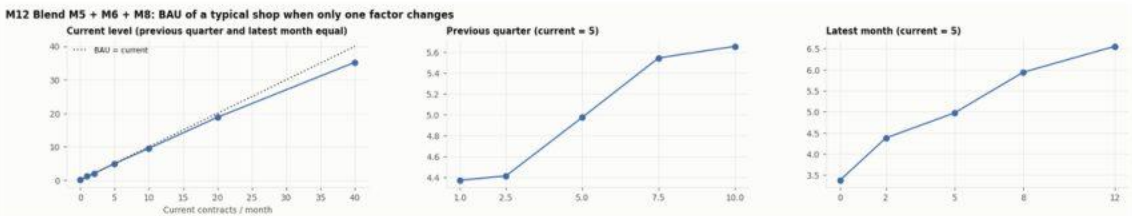

“Keep-as-is” underestimates low-volume shops by 64%. The blend fixes this, and that matters because BAU is the baseline for each shop’s headroom.

BAU Forecast

The model follows recent sales, not shop labels, and Q4 lands within −5% to +7% of today's level.

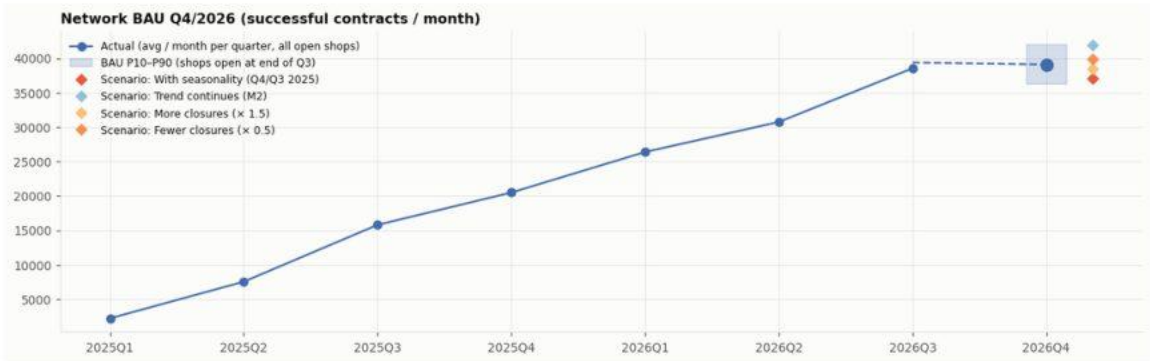

The model behaves the way an operator would expect

- Recent results drive the forecast: last month (+39%) and current-quarter level (+29%) matter most; age, size and partner type add almost nothing.
- Common-sense responses: a 40-contract shop is forecast at 35, and a shop whose last month is zero is pulled down sharply.
- Independent methods agree: with calendar and seasonality adjustments left out, three approaches land within 37.6K–39.4K (error per shop 1.693 to 1.732).

Q4/2026 lands near today's level, within about ±7%

41,186	Q4 contracts/month (current 41,467), incl. online contracts from shop leads
36.3K–41.9K	Network P10–P90, shop-booked contracts only (point 39,102)
78–82%	Shop-level actuals falling inside their P10–P90 band (target 80%)

KEY TAKEAWAY

Why trust the range: it combines one shock shared by all shops with each shop's own error.
What would move it: seasonality −5.3%, momentum continuing +6.9%, closures ±1.8%.

BAU in Money

Contracts stay flat but value rises about 4%, because the average loan keeps growing.

value grows while volume does not

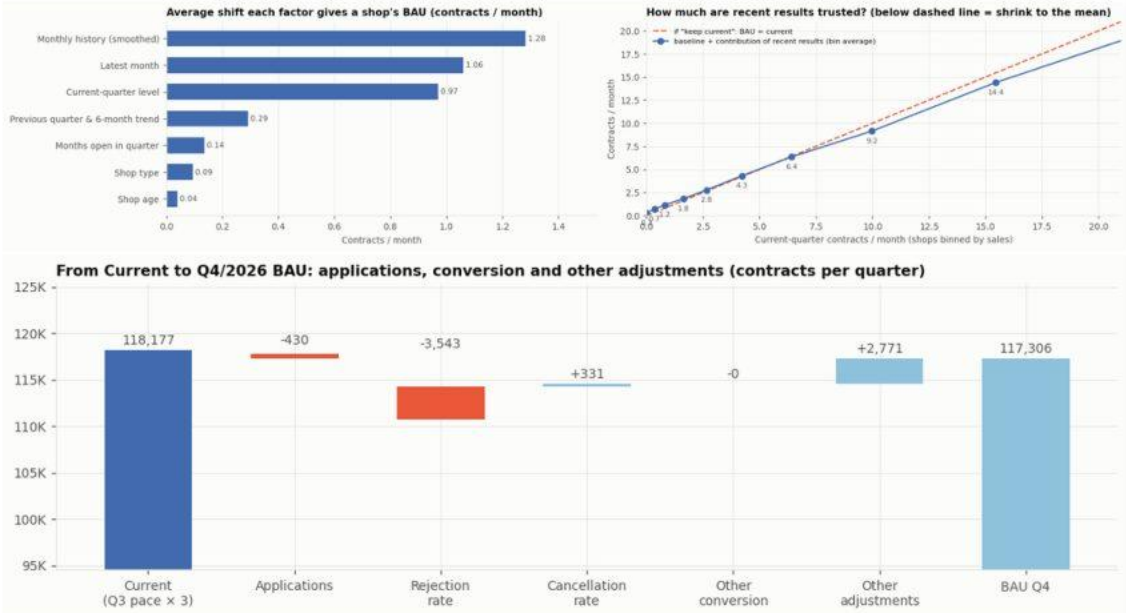

- Contracts first, money second. One 30M motorbike loan can swing a small shop's whole quarter, so volume is forecast first and loan size is applied after.
- Loan size is trending up (about 11M → 14M in a year). We backtested three ways to project it (hold flat, damped trend, full trend) and chose the full trend by segment.
- Result: 548 → 572 bn VND/month (+4%) = contracts −0.7% and average loan +5.1%.

KEY TAKEAWAY

Without changes, the network stands still. Set each shop's quarterly KPI from its BAU with a P10–P90 range, not "today × 3". Watch early the 443 shops with zero contracts last month and the 340 at high closure risk.

Every shop's BAU can be explained

- Recent results explain 93% of each forecast and add up exactly to the shop's BAU. Two shops at about 11 contracts/month differ because of last month and monthly history, not shop type or age.
- Why each shop gets its number: recovering from a very low level 3,477 · maturing 3,067 · stable 2,296 · zero contracts last month 443 · high closure risk 340 · pulled back from a very high level 330.
- Biggest drag is rejections: applications 55,025 → 54,276, rejection rate 20.6% → 22.1%, cancellation rate 7.8% → 7.5%.

Attainable Potential: How we estimate it

We size each shop's gap against peer P75, but only count the uplift that measured levers can actually deliver.

Size the gap

- Compare each shop with peer P75 (the "good shop" in the same group)
- P75 tells us how far a shop is behind, not how much it can gain

Measure lever impact

- Track the same shop across 2 quarters, net of segment trend
- +1 campaign lead/month → +0.58 contracts (Aldi), +0.22 (Non-Aldi)
- +1 SA → +0.52 (Aldi only)
- Closing gaps close on their own (82–100%), so only the remaining 18% is counted

Apply guardrails

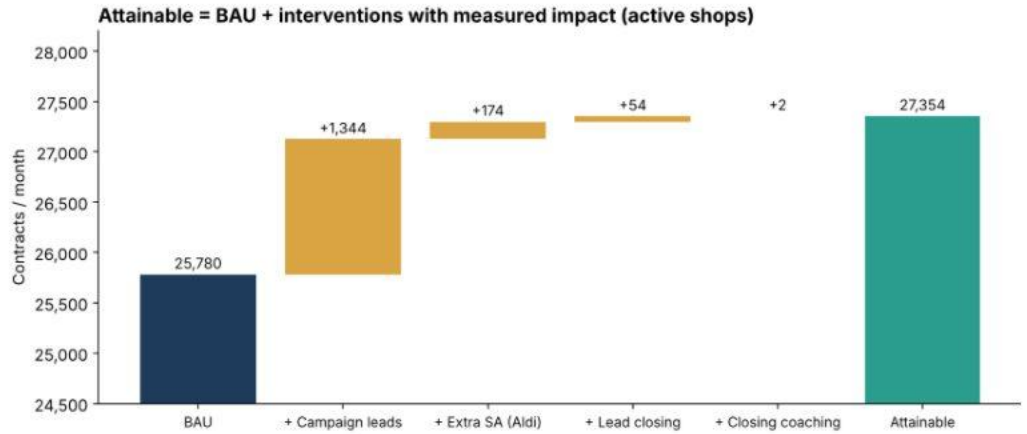

- Total extra applications ≤ gap to P75
- Recalculate the full funnel (some applications still get rejected
- Never exceed the shop's market Ceiling
- 465 high-risk shops (FPD > peer P90): Attainable = BAU

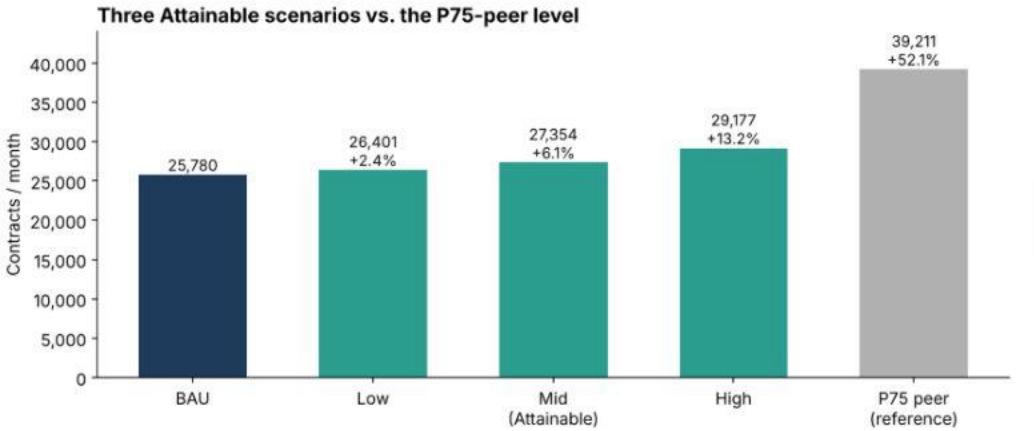

KEY TAKEAWAY

P75 tells us where a shop could be; measured impact tells us what it will realistically gain. This keeps the target evidence-based and avoids double counting.

Attainable Potential: Which levers, how much uplift

Evidence-based levers add +1,574 contracts/month (+6.1% vs. BAU), and 85% comes from campaign leads. Taking peer P75 directly would overstate this at +52%.

KEY TAKEAWAY

Weak shops don't lack closing skills; they lack customers. Send more campaign leads to shops below peer P75. Leave approval relaxation to the Risk team, because it adds volume but also bad debt.

Addressable Market Ceiling

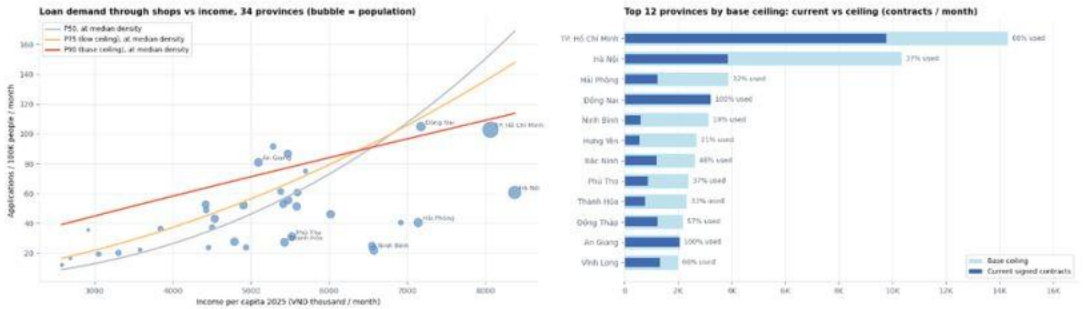

Network Operates at 57% of Capacity, Leaving Uncaptured Market Potential

How the Addressable Market Ceiling is built: a chain of conditional rates by province

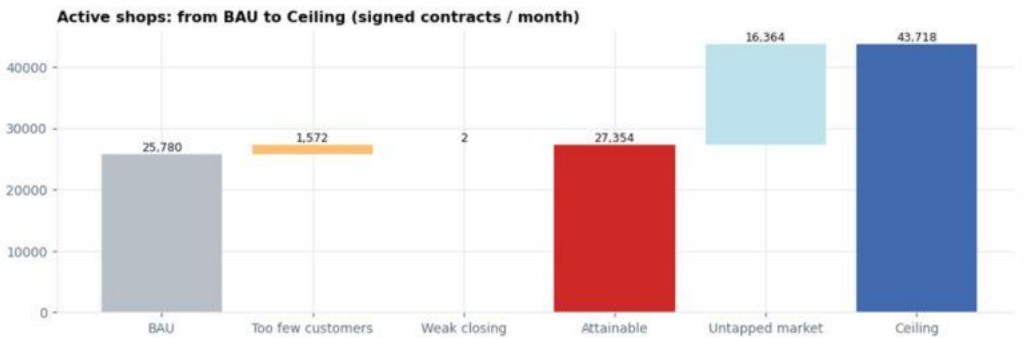

High scenario = base ÷ 50% (share of partner demand the company captures; sensitivity 30–70%)

PROVINCE BREAKDOWN: Each point represents a province vs. P90 peer benchmark; points below the line indicate unserved demand.

- **Scenario Benchmarks:** Low / Base / High: **54,701 / 72,242 / 144,483** contracts/month (**754B / 1,000B / 2,000B** VND). High-scenario market share sensitivity (**30–70%**): **241K–103K**.
- **High-Gap Provinces**: Hanoi, HCMC, Hai Phong, Ninh Binh, and Hung Yen show highest uncaptured potential; **2,190** shops have exceeded their estimated ceilings.
- **Cross-Validation**: Non-RTDM leads (**45,311/month**) × P90 contract/lead rate **(1.59) = 71,965**, closely matching the base ceiling **(72,242).**
- **Active Shop Ceiling**: Active shops cap at **43,718** contracts/month; current targeted measures capture only **~10%** of market potential.

IMPACT GAP: Actionable shop-level capacity (+1,572 low traffic, +2 poor closing) is small compared to uncaptured market size (+16,364).

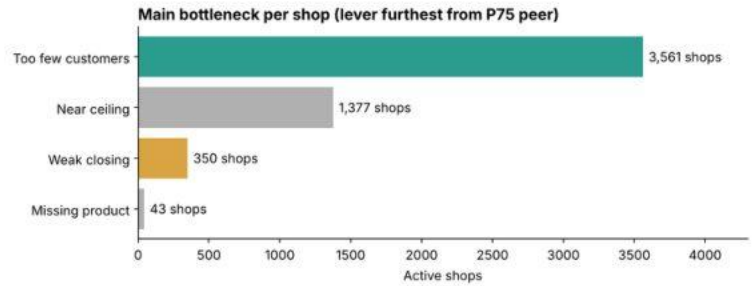

KEY TAKEAWAY

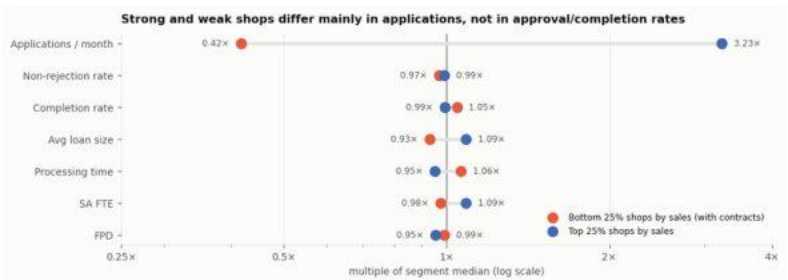

Market size is not the constraint for most shops. The bottleneck is customer routing. Unlocking growth beyond +6% requires new measures in high-potential provinces and pilot testing.

Gap and underlying causes: both shops are performing at the same level, which one still has room for growth?

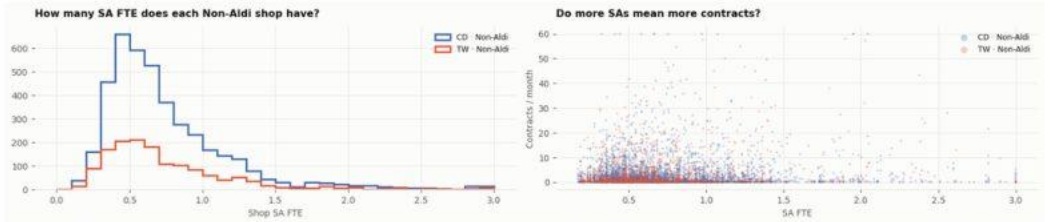

Growth upside for each store is measured by its distance to P75 peers and its local market ceiling. Currently, the primary bottleneck across the network is traffic generation: the 1,574 monthly contract opportunity stems entirely from low application volume rather than poor conversion rates or product gaps.

Traffic shortage is the primary bottleneck for two-thirds (67%) of active stores, while poor conversion and product gaps represent a minority of cases.

High-performing stores generate ~8× more application volume than low-performing ones, while approval (x1.02) and completion rates (x0.95) remain virtually identical—confirming that the performance gap lies strictly in lead acquisition.

Assigned SA headcount shows near-zero correlation with store sales (r = 0.02 - 0.05), indicating that staffing operates as an operational flag rather than a hard constraint on performance.

Methodology

- Intervention Opportunity: Calculated as Attainable (Mid scenario) − BAU. Unreached market potential = Ceiling − Attainable.
- Primary Bottleneck: Identified as the leverage factor with the largest gap compared to peers: traffic shortage (applications below attainable), poor conversion (post-approval conversion rate < P75), product gaps (≥ 50% of peers sell items the store does not), or missing SA (Non-Aldi stores with zero assigned Sales Associates).
- Diagnostic Matrix: Evaluates stores using current sales volume x reference headroom, mapped against absolute thresholds: near ceiling (<0.5 contracts/month or <15%), moderate (0.5–2), and large (≥ 2).

Results

- Bottleneck Distribution across Active Stores:
  - Traffic Shortage: 3,561 stores
  - Near Ceiling: 1,377 stores
  - Low Conversion: 350 stores
  - Product Gap: 43 stores
- Diagnostic Matrix Insights:
  - < 1 Contract/Month Tier: 1,634 stores hold large upside potential.
  - 3 - 10 Contracts/Month Tier: 764 stores operate near ceiling, while 238 stores retain substantial upside.
  - Takeaway: Current sales volume does not dictate capacity—stores with identical output exhibit vastly different headroom.
- Case Study (HCMC + TW + Non-Aldi + Medium + Stone Shop):
  - Store #117673569: ~4 contracts/month with +1.8 contracts/month upside, constrained by traffic shortage (Target = 9.0 applications; partner operates a 5-store chain; CC and BNPL unpenetrated).
  - Store #96605617: ~4 contracts/month, operating at near-zero headroom.

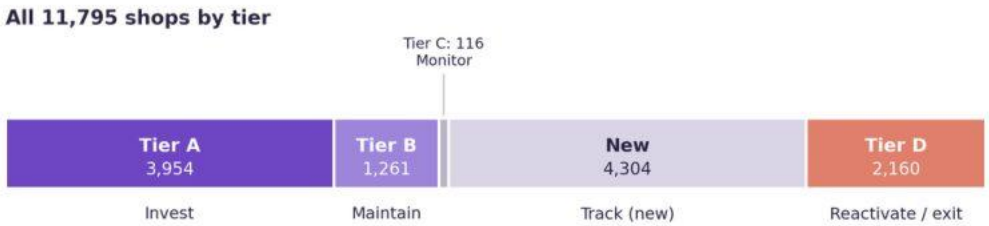

KEY TAKEAWAY

Two stores with identical sales differ in lead acquisition capacity, not conversion ability. Consequently, performance evaluation for each store must yield an actionable gap figure paired with a specific bottleneck, rather than a broad generic label.

Prioritization

Invest in 3,954 tier-A shops, starting with the top 500 for +392 contracts and +6.4 bn VND a month.

Step 1 – Sort all 11,795 shops by status and headroom

Step 2 – Score by risk-adjusted headroom, not by sales

- **Value uplift =** *(Attainable − BAU) × expected loan size*
- **Penalty 0.5 =** *FPD or DPD above peer P90 (465 shops, excluded from the budget line)*
- **Penalty 0.2 =** *fewer than 10 mature contracts (too little evidence)*

Step 3 – Fund shops in score order until returns flatten

- Top 500 → +392 contracts · +6.4 bn VND / month (range 2.6–13.8 bn)
- ≈ 60% of the value of the top 1,000 for half the shops
- 499 / 500 top shops are short of customers → lead routing first

KEY TAKEAWAY

Rank shops by risk-adjusted headroom, not by sales. Fund the top 500 first, prove the uplift in a pilot, then extend to 1,000–2,000 shops (+712 to +1,252 contracts a month)

Business Recommendation

1. Allocate Leads to Drive Volume at Shops with Growth Potential

PROPOSED METHODOLOGY

- Allocate leads based on **Growth Potential + Product Match + Handling Capacity**, followed by a controlled pilot validation.

Execution Roadmap

#1 **Filter Shops:** Select shops with Attainable > BAU, no risk blocks, and capacity to handle leads.

#2 **Prioritize & Match:** Rank by incremental value; match leads by product and location.

#3 **Add Lead Volume:** Allocate ~14,250 leads/quarter for CD and ~3,351 leads/quarter for TW.

#4 **Assign SLA:** Assign owners; mandate same-day contact; reallocate unprocessed leads.

#5 **Weekly Review:** Monitor pending leads, conversion rates, and SA workload to adjust.

Growth Impact

Shop Segment	BAU	Attainable	Growth Impact
CD · Non-Aldi	2,491.2	3,478.7	+987.5 (+39.6%)
TW · Non-Aldi	1,138.1	1,386.7	+248.6 (+21.8%)

Business Recommendation

2. Optimize Staffing & Process Execution to Elevate Sales Productivity

PROPOSED METHODOLOGY

- Conduct separate A/B pilots for **Staffing Support and Performance Coaching**, matching control groups with similar shop attributes.

Execution Roadmap

#1 **Audit Workload:** Evaluate actual working hours, active leads handled, and shop-to-SA coverage ratios.

#2 **Pilot SA Deployment:** Test additional SA allocation at Aldi shops; determine transfer vs. hiring needs.

#3 **Funnel Review:** Audit low-conversion shops across 4 key steps: Contact → Advisory → Application → Signing.

#4 **Targeted Coaching:** Log drop-off reasons and conduct weekly coaching on recurring failure patterns.

#5 **Track Productivity:** Measure output based on actual working hours rather than assigned SA headcount.

MODEL PROJECTED KPIS & IMPACT

Key factors	KPI increase
260 NS · Aldi Shops (SA Staffing)	+137.5 /mo **(+33.3% Growth)**
104 CD/TW Shops (Conversion Focus)	+14.8 /mo

Unit: Contracts / Month

Business Recommendation

3. Maximize Customer Lifetime Value via Timely Nurturing & Cross-Selling

Strategic Opportunity Baseline

- ~28,611 New Customers / Month
- 9.1% Re-borrow within 12 Months
- 95% of Repeat Borrowers Transact Elsewhere

PROPOSED METHODOLOGY

- Segment customers by **Journey Stage + Intent + Credit Eligibility**, followed by targeted CRM pilot tests.

Execution Roadmap

#1 **CRM Tagging:** Link originating shop IDs, capture explicit customer needs, and log preferred communication channels.

#2 **Post-Purchase Nurturing:** Track repayment records and update customer intent profile prior to new loan offers.

#3 **Targeted Cross-Sell:** Offer tailored Cash Loans (CL) or Credit Cards (CC) matching specific customer needs.

#4 **Channel Orchestration:** Align POS and online channels to avoid duplicate customer outreach.

#5 **Control Group Tracking:** Maintain holdout groups to measure organic repeat loans vs. campaign uplift.

KPI & IMPACT CALCULATION FRAMEWORK

Main KPI	Meaning
Company Incremental Contracts	Primary KPI
Repeat Borrowing Rate	Retention KPI
Cost / Incremental Contract	Efficency KPI

Business Recommendation

4.Tailor Lead Engagement Strategy to Eliminate Waste & Boost Conversion

PROPOSED METHODOLOGY

- **A/B test** advisory scripts, communication channels, and application completion support workflows.

Tailored Execution Matrix

#1 **Cash Loans (CL) :** Inquire on loan purpose, amount needed, and repayment capacity; consult best-fit financial products rather than pushing generic CL.

#2 **Credit Cards (CC) :** Pilot App/SMS first; hand over to human SA only when customer responds or explicitly requests advisory support.

#3 **Cancelled Apps:** Outreach within 24 hours as a test process; categorize drop-off reasons: lost interest, loan terms, paperwork, or friction in process.

KPIs & EXPERIMENTAL PILOT TARGETS

CL Conversion Uplift Target	Across 7,034 benchmarked leads, a +1% CR gain yields ~70 incremental contracts/month.
CC Digital First Strategy	Prioritize Cost/Contract; scale digital channels only if unit costs drop without deteriorating CR or portfolio quality.
Cancelled App Recovery	Measure incremental completion rate vs. control group; withhold fixed target until root-cause drop-offs are

Business Recommendation

5. Reallocate POS Network to Maximize Market Penetration & Efficiency

REACTIVATION TARGET:

- **696 Inactive Shops Identified** for **Potential Reactivation**

Tailored Execution Matrix

#1 **Root Cause Audit:** Verify why transactions stopped (customer shortage, SA vacancy, partner drop-off, or data delay).

#2 **Prioritize Candidate POS:** Select shops with willing POS partners, strong local demand, and reasonable revival costs.

#3 **Phased Pilot Activation:** Roll out reactivation pilots in batches with dedicated owners and explicit budget allocations.

#4 **Post-Pilot Review (1–3 Months):** Maintain ongoing support for responsive shops; reallocate capital away from unresponsive ones.

#5 **New Store Expansion Gatekeeper:** Assess new POS openings only after auditing existing coverage to avoid cannibalization.

KPIs & EXPERIMENTAL PILOT TARGETS

KPI Target	Meaning
Contracts / Reactivated POS	Primary metric
Reactivation Rate (%)	Yield metric
Cost / Incremental Contract	EEfficency metric
Total District Uplift	Regional impact
